

Wyse Rapport V4.4 Highlights

1. **Easier Installation:** An "Express" installation has been added to the Workgroup edition of Wyse Rapport in version 4.4. It now can pre-determine necessary prerequisites (MDAC, MSDE), and potential conflicting applications/services BEFORE installing Rapport.
2. **Enhanced Uninstall Functionality:** Wyse Rapport V4.4 now completely uninstalls all files associated with the installation of the Wyse Rapport V4.4 product and allows users to re-install the Wyse Rapport V4.X product when necessary.
3. **Integration of Wizard:** The WISard (Wyse Imaging System) is now installed during Wyse Rapport V4.4 product installation.
4. **Workgroup Edition Licensing:** Wyse Rapport V4.4 now ships with a 750-seat Workgroup Edition key. Additional Workgroup Edition keys are available through Wyse Customer Support or Wyse Rapport Product Management.
5. **Sales Key Activation:** <https://www.rapportlicensing.com>, which is accessed from the Licensing panel of Wyse Rapport, is a dedicated web page for activating Wyse Rapport sales keys. This sales key activation page will perform and function exactly as the current sales key activation page for the Wyse Rapport Version 4.X License server.
6. **Import available to Workgroup Edition customers:** The import function, which allows import of IP ranges, subnets, and remote repositories, is being made available to Workgroup edition customers (this has previously been an Enterprise-only option).
7. **Aggregate documentation:** The different documentation sets have been aggregated into an easier to use format. Changes made to Wyse Rapport Technical Documentation include:
 - New Document Install Workflow
 - Replace existing Installation procedures to reflect changes to install flow.
 - Replace previous screen shots with new Rapport 4.4 screen shots.
8. **Make discovery process easier:** Wyse Rapport V4.4 adds a discovery dialog wizard, the ability to programmatically rediscover a device after agent upgrade and a discovery progress bar to provide administrator feedback on the status of device discovery on the network.
